

These themes are supposed to be used with reaper 5, NOT previous Reaper versions. This, if possible, with an installed and compatible version of SWS extensions (starting from 2.6.0, if I remember well...).

Main changes from *CubicPack2* :

- The audio type of tracks is now the default. There are still layouts to have tracks without header, though.
- The icons graphic files in the official list have been integrated in each theme, this to allow a default display of Reaper main toolbar.
- No more scripts, added commands and .ini files : let's make things simple...
- The themes have been designed to be used with the -72/+6 dB volume fader range (*Preferences>Appearance>Track Control Panels*), but there are now duplicated layouts for the mixer that allow the use of a -72/+12dB one.
- Numerous graphic and Walter changes.

Installation

There are four themes (*.ReaperThemeZip* files) in the pack, two of them being with adjustable mixer panel heights (the ones with an *R* suffix). The four themes should be put in the *\ColorThemes* subfolder of your Reaper installation (to check the exact path, use the *Options > Show REAPER resource path in Explorer/Finder* command).

The added *.ReaperMenu* files are actually toolbars to be used with the themes ; they should be put in the *\MenuSets* of the same Reaper installation, then loaded with the *Customize menus/toolbars* window, without forgetting to save your owns toolbars first.

The added folders are a kind of icons pools that allow a redefining of given toolbars, this, with frames to compose your owns.

About the toolbars

Their name should be self-explanatory, with four toolbars for each theme type. In each theme, all the icons files necessary to allow their display have already been implemented. The three Ripple ones are present as duplicated : the default ones are present with the usual 30 x 30 pixels format, as *toolbar_ripple_[all/off/one].png*. But there are also available with a 120 x 30 pixels one ; their name being preceded by an underscore (_). This allow swapping between the two, while keeping in mind that in all cases, there must be the three files named exactly as the default ones to allow a correct display of the *Ripple* command state.

Hope these themes will be useful for some of you...
